

Revision Thu:

Update your application to allow users to remove an item from an existing order.

Add a new menu option that allows the user to enter an order number and remove a specific item from that order. When this option is selected, the program should prompt the user for an order number, locate the corresponding order, and display the items currently in that order. The user should then be able to enter the name of the item they wish to remove.

If the order is found and the item exists in that order, remove the item and display a confirmation message indicating that it has been successfully removed. If the item is not found in the order, display an appropriate message. If the order number does not exist, display a message indicating that the order was not found. Use the existing methods and functionality in your solution wherever possible.

```
...
=== Restaurant Menu ===
1. View Menu
2. View Vegetarian Dishes
3. View Allergen-Free Dishes
4. Add Item to Order
5. Customize Order Item
