

Extension 1: Bonus Zones (IDs ending with 3, 6, 9)

In this extension you will implement special bonus zones (row or column) that give extra points based on the player's position at the beginning of their turn. Any player who starts their turn on a cell that belongs to a bonus zone immediately gains +1 bonus point, before moving.

- At the start of the game, choose either one row or one column on the board as the active bonus zone. Players that start on this row or column gain +1 bonus points on their first turn.
- The bonus zone does not stay in the same place for the entire game. After every player has played their turns, you must replace the current bonus zone with a new random row or column.
- You may use a special background color, pattern, or image for the entire row or column, while still drawing walls, players, and pickable objects normally on top.

Extension 2: Terrain Modifier Cells (IDs ending with 1, 4, 7)

In this extension, you will add a new type of cell that changes into a wall after a player moves off of it.

- At the beginning of the game, place a few terrain modifier cells at random valid locations on the board.
- When a player moves onto a terrain modifier cell, nothing special happens immediately. However, once the player moves off the terrain modifier cell, the cell permanently transforms into a wall.
- After this transformation, the cell must behave the same way as any other wall on the board and block movement for the rest of the game.
- These cells must be visually distinct from normal empty cells so that players can recognize them before moving. You may use a special color, pattern, or image to indicate that a cell is a terrain modifier cell.

Extension 3: Directional Walls (IDs ending with 0, 2, 5, 8)

In this extension, you will add a new type of wall that restricts movement based on direction. A directional wall can only be crossed from one specific direction and blocks movement from all other sides. For example, a wall marked with an arrow pointing to the right can be entered only when the player is moving from left to right. If the player approaches this wall from the opposite direction, or from above or below, the movement is not allowed and the cell must not be treated as reachable.

- At the beginning of the game you should generate a small number of directional walls at valid random locations on the map, in addition to the walls you already generate.
- Each directional wall must be drawn in a way that clearly shows its passable direction, such as an arrow symbol or a distinct colored edge.
- When computing the reachable cells for the current player, you must ensure that the cells behind a directional wall only appears reachable if the player is approaching it from its permitted direction
